Executive summary

Varun Beverages is a franchisee bottler for PepsiCo and accounts for more than 90% of PepsiCo's India sales volumes. It converts a licensed brand into physical volume through 50 manufacturing facilities and a distributor-led route to market, so almost all of its risk sits between the concentrate and the consumer rather than in the brand itself. This assessment identifies 24 risks, scores each on probability and impact using the method taught in the course, and carries five forward as headline risks.

The evidence points somewhere specific. Consolidated net revenue grew 8.4% in CY2025, but India revenue from contracts with customers was flat at Rs 136,046 mn against Rs 136,174 mn in CY2024, and the whole of the group's growth came from outside India. That reframes the question from whether the company is growing to whether its largest market can convert new capacity into volume in a peak season that is becoming less reliable, inside a tax category that limits pricing and against a competitor buying share on price. Under an illustrative severe stress test built on team assumptions, EBITDA margin falls from 23.3% to 15.9% and profit after tax falls 49.8%, which shows the exposure is to operating leverage rather than to the balance sheet.

Headline risk summary

Rank	Risk	P	I	Score	Rating	Category
1	R01 Peak-season weather variability in India	4	4	16	Critical	Climate
2	R02 Demerit fiscal treatment of carbonated drinks	4	3	12	High	Regulatory
3	R03 Competitive intensity and price disruption in India	4	3	12	High	Market
4	R04 Acquisition integration, Twizza and Bevco	4	3	12	High	Strategic
5	R16 PepsiCo franchise concentration and renewal terms	1	5	5	Medium	Strategic

Rank follows the risk score. R16 is carried in by a documented judgement explained in section 3.2. Source: VBL_ERM_Risk_Dashboard.xlsx, Risk Register sheet.

Assessment focus: operating, regulatory, strategic and concentration risks affecting VBL over the next 12 to 24 months.

Submitted in fulfilment of the Risk Analysis and Management project assessment. Supporting workbook:

VBL_ERM_Risk_Dashboard.xlsx.

1. Company background and the risk universe

1.1 Business model and why it shapes the risk profile

VBL is a franchisee bottler. PepsiCo owns the brands and supplies concentrate; VBL manufactures, packages, distributes and sells. The India bottling appointment and trademark licence run to 30 April 2039. VBL holds franchise rights in ten countries and distribution rights in four more, and operated 50 manufacturing facilities at 31 December 2025, 38 in India and 12 international.

Four features of that model generate most of the register. First, the portfolio is heavily carbonated, at 73.9% of CY2025 volume against 20.2% packaged water and 5.9% non-carbonated, which places the bulk of volume inside the category that regulators treat as a demerit good. Second, demand is concentrated in the Indian summer, so a disrupted April to June quarter cannot be recovered later in the year. Third, the business is capital intensive: about Rs 45,000 mn was capitalised in CY2025 including Rs 17,000 mn on four greenfield plants, which converts volume shortfalls into operating deleverage. Fourth, growth is increasingly international, at 36.4% of CY2025 contract revenue, which imports country, currency and integration exposure that did not exist at this scale three years ago.

The evidence that anchors the analysis. Consolidated net revenue grew 8.4% to Rs 216,854 mn and volumes grew 7.9% to 1,213.1 mn cases. Within that, India volumes grew 2.2% to 839 mn cases while international volumes grew 23.4% to 374 mn cases, and

India revenue from contracts was flat. VBL attributes the India outcome to adverse weather during parts of the year, and reported that Q2 CY2025 India volumes fell 7.1% on unseasonal rainfall.

1.2 The risk universe: 24 risks across five categories

ID	Category	Risk	P	I	Score	Rating
R01	Climate & Environment	Peak-season weather variability in India	4	4	16	Critical
R02	Regulatory & Compliance	Demerit fiscal treatment of carbonated drinks	4	3	12	High
R03	Financial & Market	Competitive intensity and price disruption in India	4	3	12	High
R04	Strategic & International	Acquisition integration - Twizza and Bevco	4	3	12	High
R05	Financial & Market	Input-cost inflation in sugar, aluminium and PET	3	3	9	Medium
R06	Strategic & International	Utilisation of the four new India greenfield plants	3	3	9	Medium
R07	Strategic & International	Currency translation exposure on international earnings	4	2	8	Medium
R08	Strategic & International	New-territory entry and non-PepsiCo lines	3	2	6	Medium
R09	Strategic & International	Country and political risk in African territories	3	2	6	Medium
R10	Operations & Supply Chain	Raw material and packaging supply interruption	2	3	6	Medium
R11	Financial & Market	Receivables and working-capital stretch	3	2	6	Medium
R12	Strategic & International	Capital allocation discipline	2	3	6	Medium
R13	Regulatory & Compliance	Health labelling and consumer-health regulation	3	2	6	Medium
R14	Regulatory & Compliance	Packaging EPR and recycled-content cost	3	2	6	Medium
R15	Operations & Supply Chain	Labour cost and industrial relations	3	2	6	Medium
R16	Strategic & International	PepsiCo franchise concentration and renewal terms	1	5	5	Medium
R17	Operations & Supply Chain	Product safety and recall	1	4	4	Low
R18	Financial & Market	Consumer preference shift away from sugar CSDs	2	2	4	Low
R19	Climate & Environment	Water availability and groundwater regulation	2	2	4	Low
R20	Climate & Environment	Carbon, energy and emissions regulation	2	2	4	Low
R21	Operations & Supply Chain	Distribution and route-to-market execution	2	2	4	Low
R22	Operations & Supply Chain	Cold-chain and visi-cooler reliability	2	2	4	Low
R23	Operations & Supply Chain	IT and cyber security	2	2	4	Low
R24	Financial & Market	Funding, interest rate and liquidity	1	2	2	Low

Risks in bold are the five carried forward. Source: team risk register, VBL_ERM_Risk_Dashboard.xlsx, Risk Register sheet. The universe starts from the twelve categories in VBL's Risk Management Policy and the risks disclosed in the CY2025 annual report, then adds risks the team judged material from the evidence. Sub-risks are nested inside a parent risk rather than double counted.

2. Method: identification, causal analysis and scoring

2.1 Process

We follow the seven-stage risk management process taught in the course: establish the context, identify, analyse, evaluate, treat, monitor and review, and communicate. Stage 1 used VBL's value chain, process map, financial statements and internal control disclosures. Stage 2 used the company's own disclosed risks as a prompt list, then cause-and-effect analysis to widen the universe. Stage 3 assessed each risk on probability and impact and recorded it in the register. Stages 4 and 5 produced the prioritisation and the treatment plan set out later in this report.

2.2 Cause and effect (fishbone) analysis

Causal analysis after Ishikawa, as taught in Stage 3 of the course. Categories are the five used in the register; the spine runs to a single effect so that causes stay distinct from consequences.

2.3 Scoring

Probability (chance of occurring within 12 to 24 months)	Impact (adverse effect on annual EBITDA)
5 Very High >70% · 4 High 50-69% · 3 Medium 30-49% · 2 Low 10-29% · 1 Very Low <10%	5 Severe >Rs 5,000 mn · 4 Major Rs 2,500-5,000 mn · 3 Moderate Rs 1,000-2,500 mn · 2 Minor Rs 250-1,000 mn · 1 Insignificant <Rs 250 mn

Risk score = Probability x Impact. Rating bands: 1 to 4 Low, 5 to 9 Medium, 10 to 15 High, 16 to 25 Critical. The probability bands are the quantitative bands given in the course material. The impact bands are anchored to CY2025 audited consolidated EBITDA of Rs 50,494 mn, so a Major impact means roughly 5 to 10% of a year's EBITDA.

These thresholds are TEAM ANALYTICAL THRESHOLDS. VBL discloses a risk management framework and a list of risk categories but no numerical risk appetite and no scoring scale, so the bands are ours and are labelled as such in the workbook. Each score is a structured analytical assessment rather than a statistical probability estimate, and the register records the evidence behind every rating.

A note on residual risk. The register carries one score per risk, assessed as the risk stands today with the controls VBL already has in place, and a separate column records those controls. Residual-risk analysis is a team-applied ERM extension linked to existing controls and Stage 5 risk treatment; it is not presented as a Chapman scoring formula. Where controls demonstrably work the effect shows in the single score: input-cost inflation scores 9 rather than 12 because backward integration and consolidated sourcing held gross margin at 55.2% in CY2025 against 55.5% in CY2024.

3. Prioritisation

3.1 Probability-impact matrix

IMPACT \ PROBABILITY	1 Very Low <10%	2 Low 10-29%	3 Medium 30-49%	4 High 50-69%	5 Very High >70%
5 - Severe	R16* 5	10	15	20	25
4 - Major	R17 4	8	12	R01* 16	20
3 - Moderate	3	R10 R12 6	R05 R06 9	R02* R03* R04* 12	15
2 - Minor	R24 2	R18 R19 R20 R21 R22 R23 4	R08 R09 R11 R13 R14 R15 6	R07 8	10
1 - Insignificant	1	2	3	4	5

All 24 risks plotted on risk score. * marks a headline risk. Green = Low, yellow = Medium, orange = High, red = Critical. Source: VBL_ERM_Risk_Dashboard.xlsx, Probability-Impact Matrix sheet.

3.2 Why these five

Ranks 1 to 4 follow the score. Peak-season weather is the only risk in the Critical band, and the three risks at 12 are the only others rated High. No other risk in the universe scores above 9, so the boundary between the fourth and fifth rank is the only judgement in the ranking.

Documented override. PepsiCo franchise concentration scores 5 and is carried in as headline risk 5 ahead of input-cost inflation, which scores 9. The reason is structural rather than arithmetic. Probability is Very Low because the India licence runs to 30 April 2039 and the dependency is mutual, since VBL supplies more than 90% of PepsiCo's India volumes. Impact is Severe because the exposure has limited substitutability within the assessment horizon: an adverse change in commercial terms, territory, portfolio requirements or renewal conditions would reach the entire India business at once. PepsiCo has a lower numerical score than input-cost inflation but is retained as a headline risk because its combination of low probability, severe potential impact and strategic concentration can be understated by pure probability-times-impact arithmetic. This is our documented judgement and not a rule taken from the course material, so we state it openly rather than adjusting a score to produce the answer we wanted. Input-cost inflation is discussed in the register and an influence diagram for it is retained in the supporting deck.

Interdependence. The five do not act separately. Input-cost inflation only becomes a margin event when it meets the pricing constraint created by R02 and R03 together; a weak season under R01 lands hardest when price is already being defended under R03; and R04 raises country and currency exposure at the same time as it diversifies away from R01.

4. The five headline risks and their influence diagrams

Notation used in all five diagrams. The diagnostic question in each is whether VBL's decision squares sit on the path from the chance node to the value node, or beside it.

R01 · Peak-season weather variability in India · 4 x 4 = 16, Critical

Evidence. India volumes grew 2.2% in CY2025 to 839 mn cases while international volumes grew 23.4%, and India revenue from contracts was flat at Rs 136,046 mn. VBL attributes this to adverse weather during parts of the year and reported Q2 CY2025 India volumes down 7.1% on unseasonal rainfall. The 2025 monsoon arrived over Kerala on 24 May, eight days early, and the season finished at 108% of the long period average. Probability is High because the event recurred within the last cycle and the peak quarter is structurally exposed. Impact is Major on a counterfactual: had India volumes grown at the consolidated rate, the shortfall is roughly 48 mn cases, about Rs 7,800 mn of revenue and Rs 2,300 to Rs 3,100 mn of EBITDA at incremental contribution, which sits in the Rs 2,500 to 5,000 mn band.

What the diagram shows. The entire top row is chance and arithmetic: monsoon onset drives peak-season volume, which drives plant utilisation, and VBL chooses nothing along that path. Both decision squares attach to the EBITDA-margin node rather than to volume, which is why controls can soften the consequence but cannot lower the likelihood. The grey arc from volume into the cost-flex decision records that the decision is only taken once April volume has been observed.

R02 · Demerit fiscal treatment of carbonated drinks · 4 x 3 = 12, High

Evidence. Carbonated and caffeinated beverages moved from 28% GST plus 12% compensation cess to a flat 40% GST with effect from 22 September 2025, so the headline tax incidence was broadly unchanged. The ERM issue is not a rate rise but the continuing classification of the category as a demerit good, which caps the pricing headroom available on 73.9% of CY2025 volume and limits the ability to pass through cost. Packaged water and juice-based drinks moved down to 5%, which is why portfolio mix is the main response. Front-of-pack nutrition labelling for high sugar products is under development. Probability is High because

the constraint is already in force and further category action is under active consideration; impact is Moderate because the effect runs through realisation rather than through a single loss event.

Squares = decisions · Ovals = chance · Double ovals = deterministic · Diamond = value

What the diagram shows. Two grey informational arcs run from the policy ovals into the pivot and relabel decisions, meaning those decisions follow the policy rather than anticipate it. The advocacy square is the only node that points back into a chance node, so it is the sole channel through which VBL can influence a probability instead of absorbing an outcome.

R03 · Competitive intensity and price disruption in India · 4 x 3 = 12, High

Evidence. India net realisation per case fell 1.5% in Q1 CY2026 while India volumes grew 14.4%, which is the signature of growth defended through price rather than through value. A well-funded entrant competing at low price points and a recapitalised competing bottling system make that pattern likely to persist. Applied to India revenue of Rs 136,046 mn, a 1.5% realisation decline is about Rs 2,040 mn, which sits in the Moderate band.

Squares = decisions · Ovals = chance · Double ovals = deterministic · Diamond = value

What the diagram shows. All three decisions sit directly on the path from the entrant's price points to the value diamond, so VBL is not passive here. The constraint is that the price decision is bounded by a chance node it does not control, so the company is choosing inside a ceiling set by someone else.

R04 · Acquisition integration, Twizza and Bevco · 4 x 3 = 12, High

Evidence. VBL agreed to acquire Twizza at an enterprise value of about ZAR 2,095 mn through its South African subsidiary, alongside a new Kenya subsidiary, a Carlsberg distribution agreement and PepsiCo snacks distribution in Zimbabwe and Zambia. Debtor days lengthened from 11 to 18 in CY2025, which VBL attributes to the South Africa modern-trade mix, so the working-capital effect of the international mix is already visible. Probability is High because several integrations run concurrently; impact is Moderate because the effect is margin dilution and working-capital drag rather than impairment of the core.

What the diagram shows. Both decision squares sit upstream of every chance node. That is the diagnostic point: the dominant lever is the entry and acquisition decision itself, not any post-completion mitigation. Once the transaction is signed, acquired margin, currency translation and country risk are all nature's to choose.

R16 · PepsiCo franchise concentration and renewal terms · 1 x 5 = 5, Medium, carried in by override

Evidence. The entire India portfolio is licensed from PepsiCo and VBL accounts for more than 90% of PepsiCo's India sales volumes. The India bottling appointment and trademark licence run to 30 April 2039. The risk is not termination, which the evidence does not support and which we do not claim is likely. It is an adverse change in franchise economics: concentrate pricing, territory, portfolio requirements or renewal conditions. Probability is Very Low on the licence term and the mutual dependence; impact is Severe because the exposure has limited substitutability within the assessment horizon.

What the diagram shows. Neither decision square sits on the arrows running from the PepsiCo chance node through the two deterministic nodes into the diamond. Building non-PepsiCo revenue opens a second path to value; it does not dampen the first. That is the structural reason controls cannot reduce this exposure, and why the renewal square can only shift the distribution of commercial terms rather than their severity.

5. Illustrative ERM stress test — based on team assumptions

This is an analytical stress test, not VBL guidance and not a company forecast. CY2025 audited consolidated actuals are the base. Six drivers are team assumptions; every other figure is calculated from them. The chain is volume x realisation gives net revenue, net revenue x gross margin less operating cost gives EBITDA, and EBITDA less non-EBITDA items, taxed at the CY2025 effective rate of 23.6%, gives PAT.

5.1 Drivers (team assumptions)

Driver	Base	Adverse	Severe
Probability of scenario	60%	30%	10%
Volume growth	+8.0%	+2.0%	-3.0%
Realisation growth	+1.0%	0.0%	-1.5%
Gross margin	55.2%	53.5%	52.0%
Operating cost growth	+9.0%	+9.0%	+8.0%

Driver	Base	Adverse	Severe
Non-EBITDA items (Rs mn)	11,950	12,350	12,850

Operating cost is set as a growth rate rather than as a variable cost, because most employee and other operating expense does not fall when volume falls. That is why margin compresses faster than revenue. Gross margin is the single largest lever in the severe case.

5.2 Outputs

Scenario	Volume (mn cases)	Net revenue (Rs mn)	EBITDA (Rs mn)	EBITDA margin	PAT (Rs mn)	PAT vs CY2025
CY2025 Actual	1,213.1	216,854	50,494	23.3%	30,620	n/a
Base	1,310.1	236,544	55,138	23.3%	32,981	+7.7%
Adverse	1,237.4	221,191	42,903	19.4%	23,332	-23.8%
Severe	1,176.7	207,193	32,998	15.9%	15,386	-49.8%

Source: VBL_ERM_Risk_Dashboard.xlsx, Scenario Analysis sheet. Figures in the report match the workbook exactly.

Interpretation. The stress test shows that VBL's exposure is to operating leverage rather than to its balance sheet. A 3% volume decline with a 320 basis point gross margin squeeze removes about half of PAT, because roughly Rs 69,206 mn of employee and other operating cost does not move with volume. The base case, by contrast, is unremarkable: 8% volume growth produces essentially no margin expansion once operating cost grows 9%. Net debt is not projected. Doing so would require forward capex and dividend assumptions the team cannot source from public disclosure, and inventing them would weaken rather than strengthen the analysis; consolidated net debt at the CY2025 year end was about Rs 256 mn, with the India business net debt-free and free cash of about Rs 12,250 mn, so the severe case is a margin event rather than a solvency event.

6. Risk responses, opportunities and monitoring

6.1 Treatment plan for the five headline risks

ID	Response	Existing control (VBL)	Recommended action (team)	Owner and timing
R01	Reduce	Spread across ten franchise countries; CSD, water and NCB portfolio; cold-chain and visi-cooler reach	Run a season-contingent production and inventory plan; formalise IMD seasonal outlook tracking as a board-level indicator	Supply chain and India commercial; in place before each March
R02	Reduce	Mix shift into water and juice, taxed at 5%; engagement with government alongside PepsiCo	Accelerate the shift into lower-taxed categories; model a further rate step before each pricing round	Category and finance; each annual pricing cycle
R03	Reduce	Distribution depth and visi-cooler placement; pack-price architecture; PepsiCo brand support	Defend through pack-price architecture and outlet coverage rather than headline price cuts; review realisation monthly	India commercial; monthly
R04	Reduce	Board acquisition guidelines; dedicated integration effort for newly acquired territories	Apply a 100-day integration plan with explicit margin and working-capital milestones reported to the Board	International CEO and CFO; per transaction
R16	Retain and reduce	India licence to 30 April 2039; mutual dependence; joint investment and business planning with PepsiCo	Retain the concentration as strategically necessary; widen non-PepsiCo lines at the margin and prepare renewal positioning early	Board and CEO; continuous

Response categories follow the course terminology: reduce, retain, remove and transfer. The existing-control column records what VBL already discloses; the action column is a team recommendation and is not presented as current practice.

6.2 Opportunities

Opportunity	Evidence in the CY2025 disclosure	Response
International diversification	International volumes grew 23.4% to 374 mn cases and international revenue 23.3% to Rs 77,702 mn, now 36.4% of contract revenue	Enhance: it is also the natural hedge against R01
Lower-taxed portfolio categories	Packaged water is 20.2% of volume and non-carbonated 5.9%; both categories moved to 5% GST	Exploit: the same action that treats R02
Non-PepsiCo revenue lines	Carlsberg distribution agreement and PepsiCo snacks distribution in Zimbabwe and Zambia	Enhance: opens a second value path under R16
Backward integration	Preforms, crowns, closures and corrugated boxes made in house; gross margin held at 55.2% against 55.5%	Enhance: the control that keeps R05 outside the headline five

No numerical opportunity target is set, because VBL does not publish forward targets for any of these lines.

6.3 Key risk indicators and monitoring

ID	Key risk indicator	Current value	Status	Trigger (team threshold)
R01	India volume growth, year on year	+2.2% (CY2025)	AMBER	Below +5% for a full calendar year
R03	India net realisation per case, year on year	-1.5% (Q1 CY2026)	RED	Two consecutive quarters of decline
R02	Share of volume in the 40% GST categories	73.9% (CY2025)	AMBER	Above 75%
R04	Consolidated EBITDA margin	23.3% (CY2025)	AMBER	Below 22.0%
R05	Material cost intensity, % of net revenue	44.8% (CY2025)	GREEN	Above 48%
R11	Debtor days	18 days (CY2025)	AMBER	Above 25 days
R19	Water use ratio for the India business	Not disclosed at group level	NO DATA	Cannot be set from public data

A status colour is assigned only where a defensible threshold exists. Where public data cannot support one, the status reads NO DATA rather than an invented number. Triggers are team analytical thresholds. Monitoring runs quarterly against results disclosure, with the weather indicator reviewed before each peak quarter.

7. Evaluation, limitations and conclusion

7.1 What the analysis establishes

The analysis moves beyond VBL's own disclosure in three ways. It triangulates company statements against external evidence, so the weather risk rests on VBL's own volume disclosure and on IMD season data rather than on a general claim about climate. It scores probability and impact independently and anchors impact to a financial band rather than to a word, so a Major rating means 5 to 10% of a year's EBITDA and can be tested. And it separates the risks the controls are visibly containing from those they are not: input-cost inflation sits outside the headline five because gross margin held, while weather sits at the top because India revenue did not grow.

The influence diagrams add the structural finding that the register alone cannot show. In three of the five, VBL's decisions sit beside the causal path rather than on it. Weather, policy and PepsiCo terms are chosen by others; only competition and, before signature, acquisition give the company decisions that sit directly between the chance node and the value node. That is why the treatment plan concentrates on consequence management for the first group and on decision quality for the second.

7.2 Limitations

Limitation	What it means for the conclusions
No disclosed risk appetite	VBL publishes a risk framework and risk categories but no numerical scoring scale or tolerance. All bands are team analytical thresholds.
Scores are structured judgements	Each probability is a banded assessment supported by evidence, not a statistical estimate. Two of the four High ratings rest on a single observed year.
Scenario inputs are team assumptions	The six drivers are ours. The stress test is an analytical exercise and is not a forecast or VBL guidance.
Public data limits granularity	Plant-level utilisation, territory-level margin and India water ratios are not disclosed, so R06, R09 and R19 are scored at group level only.

Limitation	What it means for the conclusions
Different accounting bases	Net revenue appears as Rs 216,854 mn in the profit and loss account and Rs 213,748 mn in the revenue-from-contracts note, which is net of discounts. The report uses the profit and loss figure throughout.
One forward figure is secondary	The Q1 CY2026 realisation decline of 1.5% comes from quarterly results reporting rather than the audited annual report, and it is the evidence that places R03 third.

7.3 Conclusion

VBL enters the next twelve to twenty-four months with a strong balance sheet, a licence running to 2039 and an international engine that is now carrying group growth. The risk is not solvency. It is that the Indian business, which still supplies roughly two thirds of revenue, is being asked to convert substantial new capacity into volume in a peak quarter that is becoming less reliable, inside a tax category that limits pricing and against a competitor willing to buy share on price. Four of the five headline risks meet at that single point, and the stress test shows what happens if they meet in the same year. The monitoring set in section 6.3 is built to detect that combination early, and the first action we would implement is the season-contingent cost and inventory playbook under R01, because it is the cheapest protection against the risk with the highest score and the fastest onset.
